Hi Jeroen,

Here is some sample text pasted from the Muhimbi Website.

In this post we'll provide a simple .NET sample that invokes our [Web Services interface](#) to carry out the conversion from PDF to PDF/A1b. The code is nearly identical to the code to [convert and watermark a simple MS-Word file](#) with the following exceptions. You can apply the same changes to the [Java sample](#) to make it do the same using that language.

1. *openOptions.FileExtension* is set to *pdf*.
2. *conversionSettings.PDFProfile* is set to *PDFProfile.PDF_A1B*.
3. The *client.ProcessChanges()* method is invoked rather than *client.Convert()*.
4. All references to watermarks have been removed as they are not part of this sample.

Some minor clean-up has been carried out as well to make the code even shorter. After running the example the resulting file validates perfectly according to Acrobat X Pro.

Best regards,

Jeroen Ritmeijer
Muhimbi
